MY I igand peptide for G protein-coupled receptor - acts by modulating column of residues 34 to 52 of the
888888	sequence in AAW31368. This fragment was obtained by purification and analysis of the N-terminal sequence of a P-2 fraction which is used in an assay to monitor ligand binding to the G protein-coupled receptor protein. Pharmaceutical compositions containing this ligand may be used as a pituitary function modulator, a centrain nervous system modulator or a pituitary function modulator. This ligand could have specific
ပ္ပ	a pancreatic function modulator. This ligand could have specific

e.g. to treat semile dementia; Alzheimer's, Parkinson's or Huntington's diseases, Creutzfeld-dakease; poisoning by heavy metals or drugs; diabetes; schizophrenia; disorders of growth hormone secretion; cancer; rheumatoid arthritis, epilepsy and many others, also to improve post-operative nutritional status and as vasopressor. Transgenic animals carrying the ligand polypeptide encoding DNA or its mutein are used to study the function of the polypeptide-expressing genes, as models of polypeptide by as source of cell lines. The ligand polypeptide as source of probes and primers; to identify related sequences; in receptor-binding assays; for production of Ab and antisers, in drug development; for gene therapy and to develop transgenic animals. The present sequence represents a bovine pituitary-derived ligand polypeptide obtained by N-terminal sequence analysis

The invention describes a method of producing a peptide comprising the excision of the N and C-terminals of a target peptide with enzymes or chemically through the attached cleavage sites repeated by ligation in a precursor protein. The method is for producing (low-molecular) peptides generacing protein applications by the gene recombination technique through tandem repeats to provide a precursor protein with specific cleavage sites. With this method, peptide production can be carried out easily to provide large quantities of the required peptides. This is the amino acid sequence of a peptide associated with the peptide production method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Process for producing peptides e.g. KiSS-1 peptide and GPR8 ligand for subsequent applications by gene recombination technique through tandem repeats to provide precursor protein with specific cleavage sites.
                                                                                                    Peptide production by gene recombination associated peptide #14.
                                                                                                                             Peptide production; low-molecular peptide; KiSS-1; GPR8 ligand; gene recombination.
                                                                                                                                                                                                                                                                                                                                                                                               ΰ
                                                                                                                                                                                                                                                                                                                                                                                               Kitada

```

The invention relates to a murine pituitary-derived ligand polypeptide which is a ligand for the G-protein coupled orphan receptor designated GPRIO (human) or URR-I (rat). Cells transformed with a vector containing the ligand polypeptide encoding DNA are used to produce a recombinant ligand polypeptide. The ligand polypeptide, and its fragments, modulate ligand polypeptide of the pituitary, central nervous system, pancreas and other tissues and can be used to screen for agents that modulate binding of the polypeptide to the receptor; to quantify the amount of receptor in a sample and to raise antibodies. They may also be used therapeutically,

New polypeptide ligand for orphan G protein coupled receptors - used for treating disorders of central nervous system, pituitary and pancreas, and for drug screening.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents a peptide fragment of a novel bovine pituitary derived ligand corresponding to amino acid residues 34 to 53 of the sequence in AAW13168 and is used in an assay to monitor ligand binding to the G protein-coupled receptor protein. Pharmaceutical compositions containing this ligand may be used as a pituitary function modulator, a central nervous system modulator or a pancreatic function modulator. This containing this ligand may be used as a pituitary function modulator. This cannot also be specific applications as a prophylactic or therapeutic agent for dementa, depression, hyperkinetic syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, trauma, growth hormone secretory disease, hyperinpidaemia, amylotrophic lateral sclerosis, acute myocardial infarction, spinocerbellar degeneration, bone fracture, trauma, atopic dermatitis, osteoprosis, asthma, epilepsy, infertility and/or oligogalactia. Assays can also be developed to screen compounds which are capable of altering the binding activity of the ligand thus affecting activation of the G protein-coupled receptor protein

The invention relates to a murine pituitary-derived ligand polypeptide which is a ligand for the G-protein coupled orphan receptor designated CRR10 (human) or UHR-11 (rat). Cells transformed with a vector containing the ligand polypeptide encoding DNA are used to produce a recombinant to the ligand polypeptide encoding DNA are used to produce a recombinant contains the ligand polypeptide. The ligand polypeptide, and its fragments, modulate function of the piulitary, central nervous system, pancreas and other contains and the receptor; to quantify the amount of receptor in a sample and to raise antibodies. They may also be used therapeutically, control real semile dementia; Alzheimer's, Parkinson's or Huntington's disabetes; schizophrenia; disorders of growth hormone secretion; cancer; rehungation entritional status and ass vasopressor. Transgenic animals carrying the ligand polypeptide encoding DNA or its mutein are used to carrying the ligand polypeptide encoding DNA or its mutein animals contains of the polypeptide expressing genes, as models of disabet, for drug screening and as source of cell lines. The ligand contains a source of probes and primers; to identify contains and assource of cell lines. The ligand antisera; in drug development; for gene therapy and to develop transgenic animals. The present sequence represents a bovine genome-derived ligand commimals. The present sequence represents a bovine genome-derived ligand contains a similar to the murine ligand-polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polypeptide ligand for orphan G protein coupled receptors - used for treating disorders of central nervous system, pituitary and pancreas, and for drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pituitary-derived ligand polypeptide; G-protein coupled orphan receptor; GPR10; UHR-1; modulator; pituitary; central nervous system; pancreas; tissue; screen; therapettic; binding; senile dementia; ligand; murine; Alzheimer's disease; Parkinson's disease; Huntington's disease; drug; Creutzfeld-Jakob disease; polosoning; schizophrenia; growth hormone; secretion; diabetes; cancer; rheumatoid arthritis; epilepsy; vasopressor; gene therapy; transgenic animal; bovine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sovine pituitary-derived ligand polypeptide fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 19; Page 151; 206pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a bovine pituitary-derived ligand fragment. It is used in the course of the invention. The specification describes an agent for modulating prolatin secretion which comprises a ligand polypeptide or a salt, for a G protein-coupled receptor (GPCR) protein. The agents for promoting prolatin secretion can be used for treating or preventing prolatins generating expensis, menopausal syndrome, euthyroid or hypometabolism. They can by used for promoting lactation in a domestic manmal and as an aphrodisiac. The agents for inhibiting prolatin secretion can be used for treating or preventing publicating and agents for inhibiting prolatin secretion can be used for treating or preventing pituitary adenomatosis, brain tumour, emmeniopathy, autoimmune disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       prolactinoma, infertility; impotence; amenorrhea; galactorrhea; acromegaly, Chiari-Frommel syndrome; Argonz-del Castilo syndrome; Frobes-Albright syndrome; lymphoma; Sheehan syndrome; dyszoospermia; contraceptive; placental function; choriocarcinoma; hydatid mole; irruption mole; abortion; unthrifty fetus; abnormal saccharometabolism; abnormal lipidmetabolism; oxytocia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Use of G protein-coupled receptor ligands - for modulating prolactin secretion or placental function, e.g. for treating menopausal syndrome, tumours, autoimmune disease or abnormal pregnancy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention provides a monoclonal antibody which has a specific reaction with the part peptide of the C-terminal of 19P2 ligand or its derivative. The antibodies can be used in diagnosis or to treat or prevent diseases associated with abnormality in the pituitary function regulatory mechanism (e.g. promotion of prolactin secretion), central nervous regulatory mechanism, and pancreatic function regulatory mechanism, and pancreatic function regulatory mechanism. The antibody-based immunoassay can also be applied in clarifying the physiological functions of the ligand and its derivative. Sequences AAY49290-302 represent peptide fragments of the 19P2 ligand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

```
This invention describes a novel oxytocin secretion-regulating agent which contains a ligand peptide or its salt for the G protein-coupled receptor protein. It is useful in the form of drugs for ameliorating, preventing and treating diseases relating to oxytocin secretion e.g. weak pains and atonic bleeding, before and after expulsion of placenta, uterine recovery failure, caesarean section, stoppage of artificial fertilization or galactostasis and is also applicable in veterinary medicine for promoting milk production in cow, goat and pig. This sequence represents a bovine peptide which acts as an oxytocin secretion
                                     Bovine; oxytocin secretion promoter; G protein-coupled receptor protein; treatment; disease; pain; atonic bleeding; uterine recovery failure; cow; caesarean section; artificial fertilization; galactostasis; goat; pig; veterinary medicine; milk production.
                                                                                                                                                                                                                                                                                                                                                                              Physiologically-active polypeptide recognized as ligand by G protein-coupled receptor protein, for promoting secretion of oxytocin, as drugs for diseases relating to oxytocin secretion and in veterinary medicine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Protection, endogenous therapeutic peptide; peptidase, conjugation, blood component, modification; succinimidyl; maleimido group; amino; hydroxyl; thiol; hormone; growth factor; neurotransmitter.

comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attached to reactive group (II) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a copelidase stabilised therapeutic peptides composed of 3-50 amino acids.

(I) are useful for modifying therapeutic peptides e.g. hormones, growth cathorise and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent composition due to rapid degradation by peptidases in the body.

Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half intracellular uptake and interference with physiological processes. AABS0829 to AABS0441 represent invention

Examplification of the present invention
                                                                                                                                                                            Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GPRIO; UHR-1; PrRP receptor; prolactin-releasing peptide; pain; central nervous system disorder; autonomic regulation; analgesic; hypotensive; blood pressure.

This invention describes a novel C-terminal fragment (I) of an isolated CC prolactin-releasing peptide (PrRP), referred to as PrRP20 and having a sequence (SI). The invention also describes (I) a therapeutic composition (CI) comprising (I) or a C-terminal fragment of PrRP referred to as PrRPB and comprising (I) or a C-terminal fragment of PrRP referred to as PrRPB and comprising (SI); (2) a diagnostic method based on antisera against PPRPSO for identification of disorders involving the central C regulation, where specific antisera against the N-and/or C-terminal control or autonomic credulation, where specific antisera against the N-and/or C-terminal cevels; (3) a rat or human receptor encoded by a 1122 nucleotide sequence (S3), fully defined in the specification; (4) treating a person suffering from a disorder regulated by a receptor (II) encoded by a sequence of the receptor; and (5) treating blood pressure, by blocking of receptors the receptor; and (5) treating blood pressure, by blocking of receptors of PRPP or its C-terminal fragment GlyllahrgprovalGlypargher activity.

(I) is useful for regulating autonomic functions, such as increasing blood pressure. (I) is useful for treating pain, for mendicament for regulating blood pressure, and for treating pain. Agonist conductance the requiating blood pressure.

CC and antagonist of (II) are useful for treating autonomic functions and treating high hood pressure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ·.

Use of G protein receptor ligand or peptide for controlling corticotropin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Wakefulness, sleep disorder, prolactin releasing peptide receptor, PrRP, GPR10, therapy, epilepsy, narcolepsy, sleepiness, sleep apnoea, insomnia, idiopathic hypersomnia, psychogenic hypersomnia; seizure, anticonvulsant,
                                                                                                                                                                                  The present sequence describes a method of controlling the secretion of corticotrophin releasing hormone (CRH), involving the use of a G protein receptor ligand. This can be used to control the secretion of CRH and is useful as an analgesic or for treating, preventing or ameliorating diseases associated with CRH secretion such as hyperaldosteronism, hypercortisolaemia, secondary or chronic hypoadrenocorticism, Addison's disease (including boredom, nausea, pigmentation, hypogonadism, hair loss, and hypotension), adreanal gland hypofunction and obesity. The incentic sequence is a peptide used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Screening for compounds useful for promoting wakefulness or sleep, and for treating sleeping disorders, e.g. insomnia, hypersomnia or sleep apnea, comprises administering a prolactin releasing peptide agonist or

The present invention relates to a method of screening for compounds for promoting wakefulness or sleep in a mammal. The method involves administering a prolactin releasing peptide (PRRP) receptor (GPR10) agonist or antagonist respectively and determining the ability of the compound to promote wakefulness or sleep. The compounds identified from the method are used in the therapy of epilepsy and other diseases associated with absence seizures and in promoting wakefulness and sleep in individuals having sleep disorders such as insomnia and narcolepsy. The receptor agonists may be used to treat common disorders which lead to sleepiness, e.g. sleep apnoea, narcolepsy, idiopathic hypersomnia and for treatening insomnia such as adjustment sleep disorder and psychophysiologic insomnia. The present sequence is bovine PRRP-31 C-terminal peptide, PRRP-20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes a method of producing a peptide comprising the excision of the N and C-terminals of a target peptide with enzymes or chemically through the attached cleavage sites repeated by lightion in a precursor protein. The method is for producing (low-molecular) peptide e.g. KiSS-1 peptide and GRRB lighnd for subsequent applications by the gene recombination technique through tandem repeats to provide a precursor protein with specific cleavage sites. With this method, peptide production can be carried out easily to provide large quantities of the required peptides. This is the amino acid sequence of a peptide associated with the peptide production method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Process for producing peptides e.g. KiSS-1 peptide and GPR8 ligand for subsequent applications by gene recombination technique through tandem repeats to provide precursor protein with specific cleavage sites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Peptide production by gene recombination associated peptide #18.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Peptide production; low-molecular peptide; KiSS-1; GPR8 ligand; gene recombination.

This sequence represents a peptide fragment of a novel bovine pituitary derived ligand corresponding to amino acid residues 34 to 54 of the sequence in AMN1368 and is used in an assay to monitor ligand binding to the G protein-coupled receptor protein. Pharmaceutical compositions containing this ligand may be used as a pituitary function modulator, a central nervous system modulator or a pancreatic function modulator. This city of man are assay to modulator. This containing this ligand may be used as a prophylactic or therapeutic capent for dementia, depression, hyperkinetic syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, trauma, growth hormone consciousness, anxiety syndrome, schizophrenia, trauma, growth hormone consciousness, mayer and polyphagia, hypercholesterolaemia, chyperglyceridaemia, hyperlipidaemia, hyperglyclocinaemia, diabetes, cancer, pancreatitis, renal disease, Turner's syndrome, neurosis, amylotrophic lateral scherosis, armsient brain ischaemia, appincerbellar degeneration, bone fracture, trauma, atopic dermatitis, osteoporosis, asthma, epilepsy, infertility and/or oligogalactia. Assays can also be developed to screen compounds which are capable of altering the binding activity of the ligand thus affecting activation of the G protein-coupled receptor protein

Hinuma S,

for drug screening. treating

The invention relates to a murine pituitary-derived ligand polypeptide which is a ligand for the G-protein coupled orphan receptor designated CPRIO (human) or URR-1 (rat). Cells transformed with a vector containing the ligand polypeptide encoding DNA are used to produce a recombinant ligand polypeptide. The ligand polypeptide, and its fragments, modulate function of the pituitary, central nervous system, pancreas and other contains and can be used to screen for agents that modulate binding of the polypeptide to the receptor; to quantify the amount of receptor in a colypeptide to the receptor; to quantify the amount of receptor in a colypeptide to the receptor; to quantify the amount of receptor in a colypeptide to the receptor; to quantify the amount of receptor in a colypeptide and to raise antibodies. They may also be used therapeutically, colypeptide and to raise antibodies. They may also be used therapeutically, colypeptide arthritis, epilepsy and many others, also to improve post. The newmatoid arthritis, epilepsy and many others, also to improve post. The mention of the polypeptide encoding DNA or its mutein are used to struck the function of the polypeptide encoding DNA or its mutein are used to struck the function of the polypeptide encoding DNA or its mutein are used to disease, for drug screening and as source of cell lines. The ligand polypeptide as source of cell lines, for indensity or related sequences; in receptor-binding assays; for production of Ab and antisera; in drug development; for gene therapy and to develop transgenic animals. The present sequence represents a bovine genome-derived ligand company and a similar to the murine ligand-polypeptide

hypothetical protein APE1427 - Aeropyrum pernix (strain K1)
C;Species: Aeropyrum pernix
C;Species: Aeropyrum pernix
C;Species: O-Aug-1999 #sequence_revision 20-Aug-1999 #text_change 20-Jun-2000
C;Accession: B72621
R;Kawarabayasi, Y.; Hino, Y.; Horikawa, H.; Yamazaki, S.; Haikawa, Y.; Jin-no, K.; Takahawa, H.; Takamiya, M.; Masuda, S.; Funahashi, T.; Tanaka, T.; Kudoh, Y.; Jin-no, K.; Takahawa, B. (1999)
A;Tile: Complete genome sequence of an aerobic hyper-thermophilic Crenarchaeon, Aeropyra, A;Reference number: A72450; MUID:99310339; PMID:10382966
A;Status: preliminary
related to BCS1 protein precursor [imported] - Neurospora crassa
Nylleanate names: protein B23L21.300
C;Species: Veurospora crassa
C;Date: 02-Un-2000 #sequence_revision 02-Un-2000 #text_change 02-Unn-2000
C;Accession: T49917
R;Schulte, U.; Aign, V.; Hoheisel, U.; Brandt, P.; Fartmann, B.; Holland, R.; Nyakatura, submitted to the Protein Sequence Database, May 2000
A;Reference number: Z2502
A;Accession: T49717

May stimulate lactotrophs directly to secrete PRL. ALTERNATIVE PRODUCTS:

-!- PRYELOPMENTAL STAGE: Initially transcribed in the cardiac crescent prior to formation of the primordial heart tube. Following formation of the primitive heart, present in both endocardium and myocardium as well as in other lateral plate derivatives. Also transcribed in the primitive embryonic gut and in late stage embryos is sequentially up-regulated in distinct segments of gastroincestinal epithelia as they undergo terminal differentiation.

-!- SIMILARITY: Contains 2 GATA-type zinc fingers.

XI New Preserver W. A. Chinkers M. M. M. Warlows O'THER CELLS

CC -! FUNCTION: IMPLICATED AS A CELL-SURFACE RECEPTOR ON SPERMATOZOA

FOR RESACY A CHEMOTACTIC PEPTIDE.

CC -! CATALYTIC ACTIVITY: GTP = 3', 5'-cyclic GMP + diphosphate.

CC -! CATALYTIC ACTIVITY: GTP = 3', 5'-cyclic GMP + diphosphate.

CC -! SUBCELLUAR LOCATION: Type I membrane protein.

CC -! SIMILARITY: Contains 1 protein kinase-like domain.

"The XTH family of enzymes involved in xyloglucan endotransglucosylation and endohydrolysis: current perspectives and a new unifying nomenclature.";

"The XTH family of enzymes involved in xyloglucan endohydrolysis (XEH) and/or plant Cell Physiol. 43:1421-1435(2002).

"I PUNCTION: Catalyzes xyloglucan endohydrolysis (XEH) and/or endotransglycosylation (XET). Cleaves and religates xyloglucan polymers, an essential constituant of the primary cell wall, and thereby participates in cell wall construction of growing tissues. Way be required during development to modify the walls of cells under mechanical stress.

"C CATALYTIC ACTIVITY: Breaks a beta-(1->4) bond in the backbone of a xyloglucan and transfers the xyloglucanyl segment on to O-4 of the non-reducing terminal glucose residue of an acceptor, which can be a xyloglucan or an oligosaccharide of xyloglucan.

"SUBCELUTAR LOCATION: Apoplast (Probable).

"I ISSUE SPECIFICITY: Highly expressed in steed in shoot apical meristems, also found in the particular particular particular meristems, also found in the stems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This SWISS-PROT entry is copyright. -!- PTM: Contains at least one intrachain disulfide bond essential for its enzymatic activity (By similarity).
-!- PTM: N-glycosylated; essential for its enzymatic activity.
-!- SIMILARITY: Belongs to family 16 of glycosyl hydrolases. XTH goup 2 subfamily.
-!- GAUTION: Ref.1 sequence differs from that shown due to frameshifts in positions 158; 178; 183; 189; 190; 194 and 199.
-!- CAUTION: Ref.6 sequence differs from that shown due to frameshifts in positions 93 and 104.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                "Complete genomic sequence of Corynebacterium glutamicum ATCC 13032.", Submitted (MAY-2002) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Baidirectionally degrades single-stranded DNA into large acid-insoluble oligonucleotides, which are then degraded further into small acid-soluble oligonucleotides (By similarity).
-!- CAPALYTIC ACTIVITY: Exonucleolytic cleavage in either 5' to 3'-
or 3'- to 5'-direction to yield nucleoside 5'-phosphates.
-!- SUBUNIT; Heterooligomer composed of large and small subunits (By

```
This sequence represents a peptide fragment of a novel bovine pituitary derived ligand corresponding to amino acid residues 34 to 52 of the sequence in AAW31368. This fragment was obtained by purification and analysis of the N-terminal sequence of a P-2 fraction which is used in assay to monitor ligand binding to the G protein-coupled receptor protein. Pharmaceutical compositions containing this ligand may be used as a pituitary function modulator, a central nervous system modulator or a pancreatic function modulator. This ligand could have specific
                                                                                                                                                                                                                                                                                                           G protein-coupled receptor; ligand binding; pharmaceutical; modulator;
pituitary; central nervous system; pancreas; prophylactic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   by modulating pituitary gland.
                                                                                                                                                                                                                                                                                          Bovine G protein-coupled receptor ligand fragment from P-2 fraction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ц,

polypeptide ligand for orphan G protein coupled receptors - used for ating disorders of central nervous system, pituitary and pancreas, and Example 16; Page 145; 206pp; English. treating disorders for drug screening

The invention relates to a murine pituitary-derived ligand polypeptide which is a ligand for the G-protein coupled orphan receptor designated GPR10 (human) or URR-1 (rat). Cells transformed with a vector containing the ligand polypeptide encoding DNA are used to produce a recombinant ligand polypeptide. The ligand polypeptide, and its fragments, modulate function of the pituitary, central nervous system, pancreas and other tissues and can be used to screen for agents that modulate binding of the polypeptide to the receptor; to quantify the amount of receptor in a sample and to raise antibodies. They may also be used therapeutically,

The invention describes a method of producing a peptide comprising the excision of the N and C-terminals of a target peptide with enzymes or chemically through the attached cleavage sites repeated by ligation in a precursor protein. The method is for producing (low-molecular) peptides e.g. KiSS-1 peptide and GPR8 ligand for subsequent applications by the gene recombination technique through tandem repeats to provide a precursor protein with specific cleavage sites. With this method, peptide production can be carried out easily to provide large quantities of the required peptides. This is the amino acid sequence of a peptide associated with the peptide production method of the invention

e.g. to treat senile dementia; Alzheimer's, Parkinson's or Huntington's diseases. Acteutzeld-dakob disease; poisoning by heavy metals or drugs; diabetes; schizophrenia; disorders of growth hormone secretion; cancer; rheumatoid arthritis, epilepsy and many others; also to improve post-operative nutritional status and as vasopressor. Transgenic animals carrying the ligand polypeptide encoding DNA or its mutein are used to study the function of the polypeptide-expressing genes, as models of polypeptide DNA is used as source of cell lines. The ligand polypeptide DNA is used as a source of probes and primers; to identify related sequences; in receptor-binding assays; for production of Ab and antisers, in drug development; for gene therapy and to develop transgenic animals. The present sequence represents a bovine pituitary derived ligand polypeptide obtained by N-terminal sequence analysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Process for producing peptides e.g. KiSS-1 peptide and GPR8 ligand for subsequent applications by gene recombination technique through tandem repeats to provide precursor protein with specific_cleavage sites.
                                                                                                                                                                                                                                                                                                  Gaps

This sequence represents a peptide fragment of a novel bovine pituitary derived ligand corresponding to amino acid residues 34 to 53 of the sequence in AMN3186 and is used in an assay to monitor ligand binding to the G protein-coupled receptor protein. Pharmaceutical compositions containing this ligand may be used as a pituitary function modulator, a containing this ligand may be used as a pituitary function modulator, a central nervous system modulator or a pancreatic function modulator. This ligand could have specific applications as a prophylactic or therapeutic agent for dementia, depression, hyperkinetic syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, trauma, growth hormone consciousness, anxiety syndrome, schizophrenia, trauma, growth hormone consciousness, anxiety syndrome, schizophrolactinaemia, diabetes, hyperglyceridaemia, hyperlipdaemia, hyperfolactinaemia, diabetes, cancer, pancreatitis, spinal disease, Turner's syndrome, neurosis, cancer, pancreatitis, spinal injury, transient brain ischaemia, amylotrophic lateral sclerosis, acute myocardial infarction, camplorosis, asthma, epilepsy, infertility and/or oligogalactia. Assays can also be developed to screen compounds which are capable of altering to binding activity of the ligand thus affecting activation of the G protein-coupled receptor protein

The invention relates to a murine pituitary-derived ligand polypeptide which is a ligand for the G-protein coupled orphan receptor designated complets a ligand polypeptide encoding DNA are used to produce a recombinant ligand polypeptide. The ligand polypeptide, and its fragments, modulate function of the pituitary, central nervous system, pancreas and other cissues and cam be used to screen for agents that modulate binding of the polypeptide to the receptor; to quantify the amount of receptor in a sample and to raise antibodies. They may also be used therapeutically, c.g. to treat senile dementia, Alzheimer's, Parkinson's or Huntington's disabetes; schizophrenia; disorders of growth hormone secretion; cancer; cheumatodia entiritis, epilepsy and many others, also to improve post-coperative nutritional status and as vasopressor. Transgent animals carrying the ligand polypeptide encoding DNA or its muteain animals cutypeptide DNA is used as a source of probes and primers; to identify of polypeptide DNA is used as a source of probes and primers; to identify crelated sequences; in receptor-binding assays; for production of Ab and animals. The present sequence represents a bovine genome-derived ligand polypeptide fragment which is similar to the murine ligand-polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New polypeptide ligand for orphan G protein coupled receptors - used for treating disorders of central nervous system, pituitary and pancreas, and for drug screening.
                                                                                                                                                                                                                                                                            pitultary-derived ligand polypeptide; G-protein coupled orphan receptor; GPR10; UHR-1; modulator; pitultary; central nervous system; pancreas; tissue; screen; therapeutic; binding; senile dementia; ligand; murine; Alzheimer's disease; Parkinson's disease; huntington's disease; drug; cretizfeld-Jakob disease; posoning; schizophrenia; growth hormone; secretion; diabetes; cancer; rheumatoid arthritis; epilepsy; vasopressor; gene therapy; transgenic animal; bovine.
                                                                                                                                                                                                                                         Bovine pituitary-derived ligand polypeptide fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example 19; Page 151; 206pp; English.

The present sequence represents a bovine pituitary-derived ligand fragment: It is used in the course of the invention. The specification describes an agent for modulating prolactin secretion which comprises a ligand polypeptide or a salt, for a G protein-coupled receptor (GPCR) protein. The agents for promoting prolactin secretion can be used for reating or preventing hypometabolism. However, cacogenesis, menopausal syndrome, euthyroid or hypometabolism. They can by used for promoting actation in a demestic mammal and as an aphrodisiac. The agents for inhibiting prolactin secretion can be used for treating or preventing prolaction can be used for treating or preventing prolactions. Drain thumour, emmeniopathy, autoimmune disease, prolactinoma, infertility, impotence, amenorthaa, galactorrhea, prolactinoma, infertility, impotence, amenorthaa, galactorrhea, coromegaly, Chiari-Frommel Syndrome, Argonz-del Castilo syndrome, Porbestonibitory agents can also be used as contraceptives. The agents for modulating placental function can be used for treating or preventing choriocarcinoma, hydatid mole, irruption mole, abortion, unthirity fetus, abnormal saccharometabolism, abnormal lipidametabolism or oxytocia
                                                                                                                                                                                                                                                                                                                                                                            G protein-coupled receptor; GPCR; hypcovarianism; gonecyst cacogenesis; menopausal syndrome; euthyroid; hypometabolism; lactation; pituitary adenomatosis; brain tumour; emmeniopathy; autoimmune disease;

```

Monoclonal antibody, 19P2 ligand; diagnosis; prolactin secretion; pituitary; regulatory mechanism; central nervous system; pancreatic.

19P2 ligand peptide fragment.

(first entry)

22-FEB-2000

AAY49301;

AAY49301 standard, peptide; 20 AA.

RESULT 7 AAY49301 20 /note= "C-terminal amide"

                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention provides a monoclonal antibody which has a specific reaction with the part peptide of the C-terminal of 19P2 ligand or its derivative. The antibodies can be used in diagnosis or to treat or prevent diseases associated with abnormality in the pituitary function regulatory mechanism (e.g. promotion of prolactin secretion), central nervous regulatory mechanism, and pancreatic function regulatory mechanism. The antibody-based immunoassay can also be applied in clarifying the physiological functions of the ligand and its derivative. Sequences AAY49290-302 represent peptide fragments of the 19P2 ligand

It is useful in the form of drugs for ameliorating, preventing and treating diseases relating to oxytocin secretion e.g. weak pains and atonic bleeding, before and after expulsion of placenta, uterine recovery failure, caesarean section, stoppage of artificial fertilization or galactostasis and is also applicable in veterinary medicine for promoting milk production in cow, goat and pig. This sequence represents a bovine peptide which acts as an oxytocin secretion
                                                Bovine; oxytocin secretion promoter; G protein-coupled receptor protein; treatment; disease; pain; atonic bleeding; uterine recovery failure; cow; caesarean section; artificial fertilization; galactostasis; goat; pig; veterinary medicine; milk production.
                                                                                                                                                                                                                                                                                                                                                                                                   Physiologically-active polypeptide recognized as ligand by G protein-coupled receptor protein, for promoting secretion of oxytocin, as drugs for diseases relating to oxytocin secretion and in veterinary medicine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The present invention describes a modified therapeutic peptide (I)

comprising a therapeutically active amino acid region (III) and a
reactive group (II) (e.g. succinimidy! and malemido groups) attached
to a less therapeutically active amino acid region (IV), which covalently
bonds with amino/hydroxy//thiol groups on blood components to form a
peptidase stabilised therapeutic peptide composed of 3-50 amino acids.

(I) are useful for modifying therapeutic peptides e.g. hormones, growth
factors and neurotransmitters, to protect them from peptidase activity in
vivo for the treatment of various disorders. Bndogenous therapeutic
peptides are not suitable as drug candidates as they require frequent
administration due to rapid degradation by peptidases in the body.

Modifying and attaching therapeutic peptides to albumin prevents or
reduces the action of peptidases to increase length of activity (half
life) and specificity as bonding to large molecules decreases
ABB90829 to AAB93441 represent peptides which can be used in the
exemplification of the present invention
                                                                                                                                                                                                         Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GPR10; UHR-1; PTRP receptor; prolactin-releasing peptide; pain; central nervous system disorder; autonomic regulation; analgesic;

This invention describes a novel C-terminal fragment (I) of an isolated CC prolactin-releasing peptide (PRRP), referred to as PrRP20 and having a sequence (S1). The invention also describes (I) a therapeutic composition (C1) comprising (I) or a C-terminal fragment of PRRP referred to as PRRPB and comprising (I) or a C-terminal fragment of PRRP referred to as PRRPB against PRRP20 for identification of disorders involving the central regulation, where specific antisera against the N-and/or C-terminal commins of PRRP is used to identify alterations in PRRP synthesis or regulation, where specific antisera against the N-and/or C-terminal commins of PRRP is used to identify alterations in PRRP synthesis or levels; (I) a rat or human receptor encoded by a 1122 nucleotide sequence (S3), fully defined in the specification; (4) treating a person suffering from a disorder regulated by a receptor (II) encoded by a sequence of 1122 nucleotide sequence. (II) when a gonist or antagonist to the central nervous system, by administering an agonist or antagonist to the receptor; and (5) treating blood pressure, by blocking of receptors of PRRP or its C-terminal fragment G1y10ArgProvalG1yArgPhe-NH 2 (S2). (The products of the invention have analgesic and hypotensive activity. (C1) is useful for regulating bain, for manufacturing a medicament for regulating blood pressure, and for treating pain. Agonist and antagonist of (II) are useful for treating action one to pain, inflammatory committed in the blood pressure.
                                                                                                                                                             prolactin-releasing peptide useful for regulating in the manufacture of a medicament for regulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cow; corticotrophin releasing hormone; CRH; G protein receptor ligand; analgesic; hyperaldosteronism; hypercortisolaemia; hypoadrenocorticism; Addison's disease; adrenal gland hyperfunction; obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   100.0%; Score 78; DB 4; Length 20; 100.0%; Pred. Use of G protein receptor ligand or peptide for controlling corticotropin releasing hormone secretion.
                                                                                                                                                                         The present sequence describes a method of controlling the secretion of corticotrophin releasing hormone (CRH), involving the use of a G protein receptor ligand. This can be used to control the secretion of CRH and is useful as an analgesic or for treating, preventing or ameliorating diseases associated with CRH secretion such as hyperaldosteronism, hypercortisolaemia, secondary or chronic hypoadrenocorticism, Addison's disease (including boredom, nauses, pigmentation, hypogonadism, hair loss, and hypotension), adrenal gland hypofunction and obesity. The present sequence is a peptide used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Wakefulness; sleep disorder; prolactin releasing peptide receptor; PrRP; GPR10; therapy; epilepsy; narcolepsy; sleepiness; sleep apnoea; insomnia; idiopathic hypersomnia; psychogenic hypersomnia; seizure; anticonvulsant;

The present invention relates to a method of screening for compounds for promoting wakefulness or sleep in a mammal. The method involves administering a proladcin releasing peptide (PrRP) receptor (GPRIO) agonist or antagonist respectively and determining the ability of the compound to promote wakefulness or sleep. The compounds identified from the method are used in the therapy of epilepsy and other diseases associated with absence seizures and in promoting wakefulness and sleep in individuals having sleep disorders such as insomnia and narcolepsy. The preceptor agonists may be used to treat common disorders which lead to sleepiness, e.g. sleep appose, narcolepsy, idiopathic hypersomnia and psychogenic hypersomnia. PrRP receptor antagonists are useful for promoting sleep and for treating insomnia such as adjustment sleep disorder and psychophysiologic insomnia. The present sequence is bovine PRRP-31 C-terminal peptide, PRRP-20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a method of producing a peptide comprising the excision of the N and C-terminals of a trarget peptide with enzymes or chemically through the attached cleavage sites repeated by ligation in a precursor protein. The method is for producing (low-molecular) peptides e.g. KiSS-1 peptide and GPR8 ligand for subsequent applications by the gene recombination technique through tandem repeats to provide a precursor protein with specific cleavage sites. With this method, peptide production can be carried out easily to provide large quantities of the required peptides. This is the amino acid sequence of a peptide associated with the peptide production method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Process for producing peptides e.g. KiSS-1 peptide and GPR8 ligand for subsequent applications by gene recombination technique through tandem repeats to provide precursor protein with specific cleavage sites.

This sequence represents a peptide fragment of a novel bovine pituitary derived ligand corresponding to amino acid residues 34 to 54 of the sequence in Amalis68 and is used in an assay to monitor ligand binding to the G protein-coupled receptor protein. Pharmaceutical compositions containing this ligand may be used as a pituitary function modulator, a central nervous system modulator or a pancreatic function modulator. This consciousness, anxiety syndrome, schizophrenia, trauma, growth hormone secretory disease, hyper and polyphagia, hypercholesterolaemia, consciousness, anxiety syndrome, schizophrenia, trauma, growth hormone secretory disease, hyper and polyphagia, hypercholesterolaemia, cancer, pancreatitis, renal disease, Turner's syndrome, neurosis, remental cancer is propolated atthritis, spinal injury, transient brain ischaemia, amylotrophic lateral sclerosis, acute myocardial infarction, anylotrophic lateral sclerosis, acute myocardial infarction, spinal asthma, epilepsy, infertility and/or oligogalactia. Assays can also be developed to screen compounds which are capable of altering containing activity of the ligand thus affecting activation of the G

The invention relates to a murine pituitary-derived ligand polypeptide which is a ligand for the G-protein coupled orphan receptor designated G Philo (human) or URI». (rat). Calls transformed with a vector containing the ligand polypeptide encoding DNA are used to produce a recombinant ligand polypeptide. The ligand polypeptide, and its fragments, modulate function of the pituitary, central nervous system, pancreas and other tissues and can be used to screen for agents that modulate binding of the polypeptide to the receptor; to quantify the amount of receptor in a sample and to raise antibodies. They may also be used therapeutically, e.g. to treat senile dementia; Alzheimer's, Parkinson's or Huntington's diseases, Creutzfeld-Jakob disease, poisoning by heavy metals or drugs; contained arthritis, epilepsy and many others, also to improve post-coperative nutritional status and as vasopressor. Transgenic animals carrying the ligand polypeptide encoding DNA or its mutein are used to struction of the polypeptide expressing genes, as models of struction of the polypeptide expressing genes, as models of struction of the polypeptide expressing genes, as models of struction of the polypeptide expressing genes; as models of struction of the polypeptide expressing genes; and models of struction of the polypeptide seques; for production of Ab and antisers, in drug development; for gene therapy and to develop transgenic antisers, in drug development; for gene therapy and to develop transgenic antisers, in drug development; is similar to the murine ligand-polypeptide
                                                                                                                                                                                                                                                                                                                                                                              Pituitary-derived ligand polypeptide; G-protein coupled orphan receptor; GPR10; UHR-1; modulator; pituitary; central nervous system; pancreas; tissue; screen; therapeutic; binding; senile dementia; ligand; murine; Alzheimer; disease; Parkinson's disease; Huntington's disease; drug; Creurzfeld-Jakob disease; poisoning; schizophrenia; growth hormone; secretion; diabetes; cancer; rheumatoid arthritis; epilepsy; vasopressor; gene therapy; transgenic animal; bovine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polypeptide ligand for orphan G protein coupled receptors - used for treating disorders of central nervous system, pituitary and pancreas, and for drug screening.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                        (without alignments)
